

Desktop as a Service QoE etc.

Understanding the basics

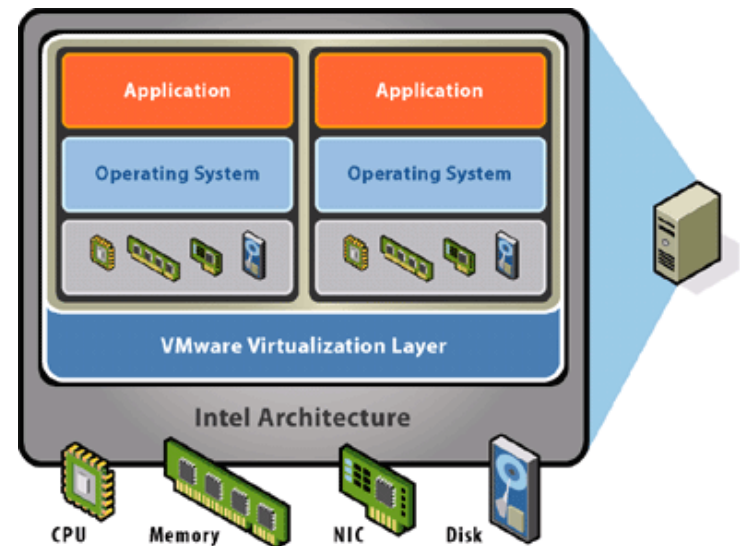

Desktop Computing

Desktop virtualization

- ▶ **Desktop virtualization** is software technology that separates the desktop environment and associated application software from the physical client device that is used to access it.

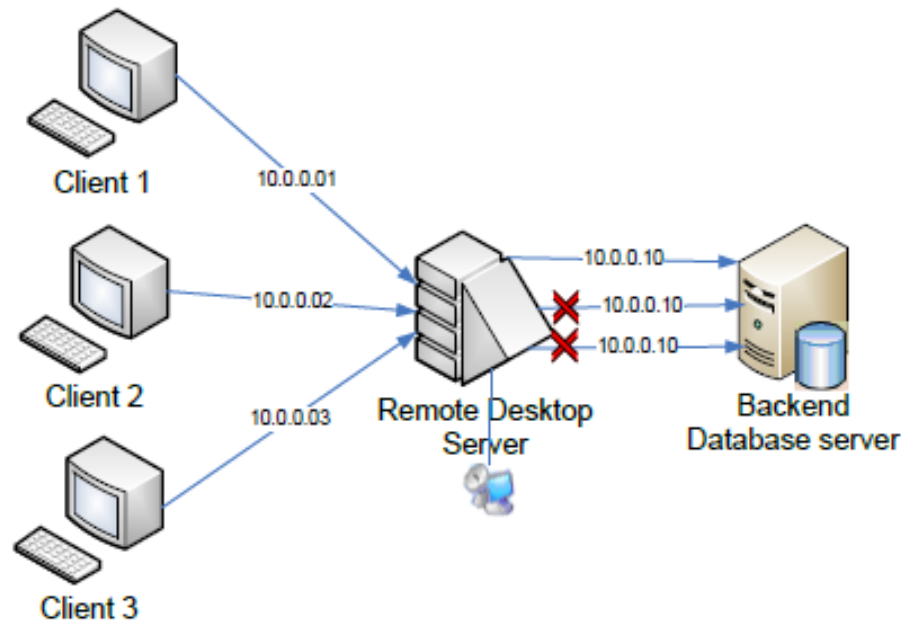

Local desktop Virtualization

Local desktop virtualization implementations run the desktop environment on the client device using hardware virtualization or emulation.

Remote desktop virtualization

- ▶ **Remote desktop virtualization** implementations operate as a client/server computing environment. Application execution takes place on a remote operating system which is linked to the local client (thin client) device over a network using a remote display protocol through which the user interacts with applications.

Remote Desktop Services (RDS)

- ▶ Remote Desktop Services (RDS) (also called terminal services, server based computing, and presentation virtualization) is a component of Microsoft Windows that allows a user to access applications and data on a remote computer over a network using a remote display protocol. Here client connects to remote computer using Remote Desktop Protocol (RDP) and gains full or specific control. Remote computer has only one OS running.

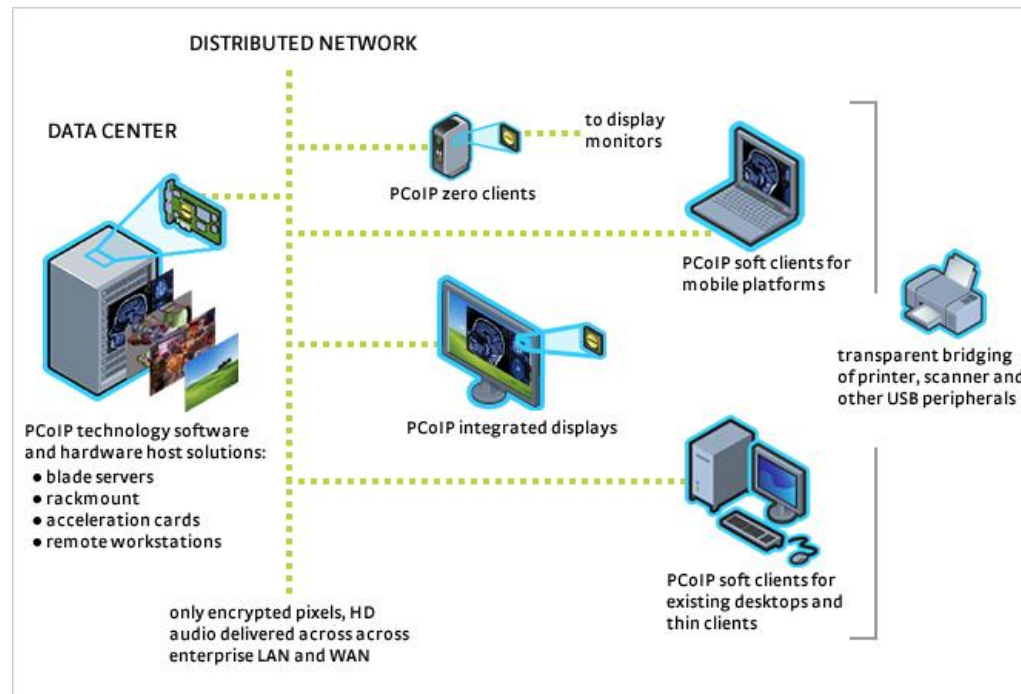

VDI

Virtual desktop infrastructure (VDI) is a desktop-centric service that hosts user desktop environments on remote servers, which are accessed over a network using a remote display protocol. Here every user is provided an individual instance of OS and provides full control of the desktop.

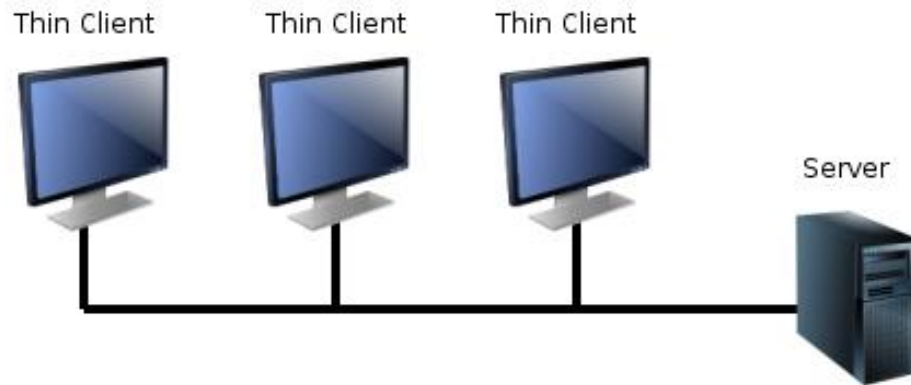

PcoIP

PC-over-IP (PCoIP) is a proprietary remote display protocol developed by Teradici. The protocol is available in hardware silicon and in software

Thin Client

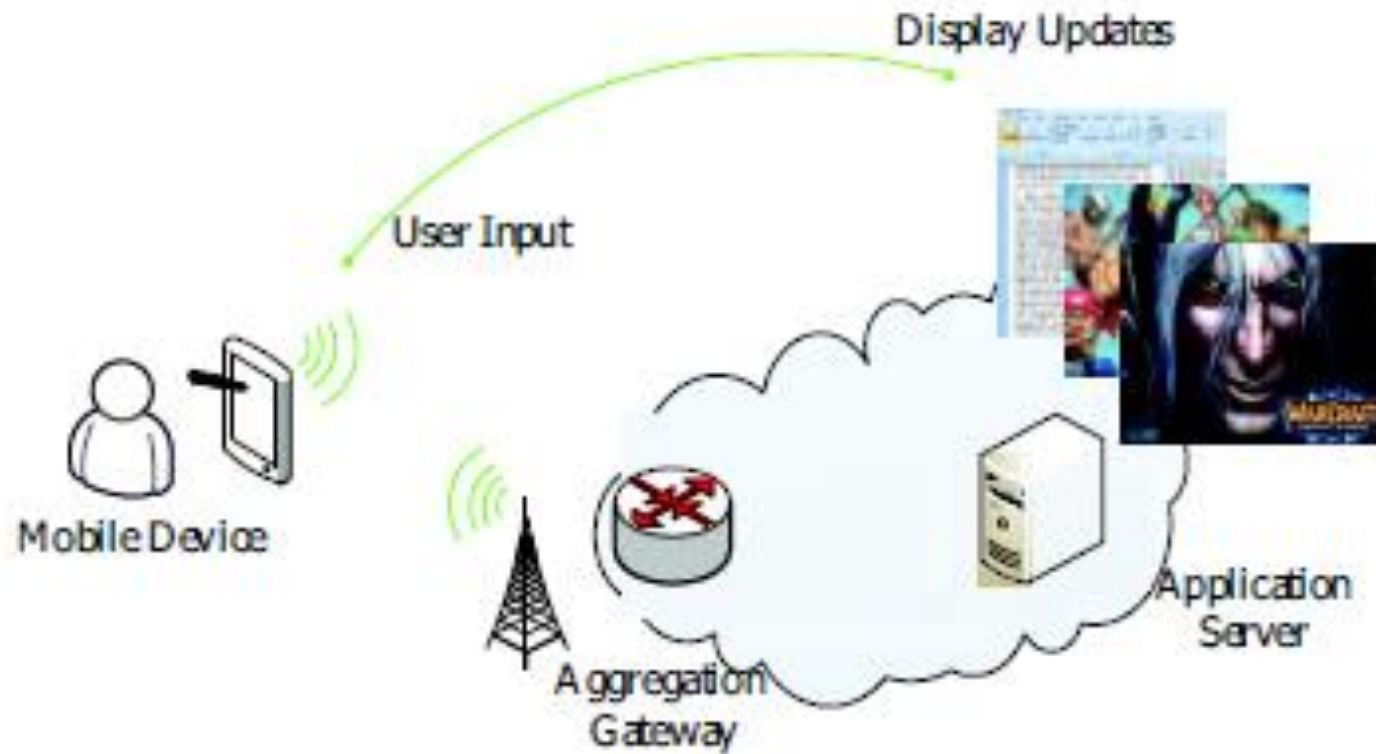

- ▶ A **thin client** (sometimes also called a **lean**, **zero** or **slim client**) is a computer or a computer program that depends heavily on some other computer (its *server*) to fulfill its computational roles.

Advantages of thin client

- Light-weight
- Cross-platform
- Low maintenance cost

Thin Client (Contd.)

Scenario of Thin Client System

DaaS

Desktop as a Service (DaaS) is a cloud computing offering where a service provider delivers virtual desktops to end users over the Internet, licensed with a per-user subscription.

Quality of Experience

- ▶ **Quality of Experience (QoE or simply QX)** is a measure of a customer's experiences with a service (web browsing, phone call, TV broadcast, call to a Call Center). QX focuses on the entire service experience, and is a more holistic evaluation than the more narrowly focused UX (user experience, focused on a software interface) and CX (customer experience, support focused).
